PROFILE

I'm a Software Developer born and raised in Buenos Aires, Argentina. I've been a software enthusiast since childhood and started programming my first websites at 16.

I dropped out of university and began my programming career self-taught. I'm primarily passionate about frontend development and crafting beautiful easy-to-use products.

As a good Argentinian, I like football, mate, and working in environments with great human and cultural values.

EMPLOYMENT HISTORY

Aug 2020 — Nov 2020 Frontend Developer, Rather Labs Buenos Aires

Joined Rather at an early stage. By using Next.js and TailwindCSS, I built the entire UI of the core product for the web which in those times was a social network for moviegoers.

Nov 2020 — Oct 2025 Software Engineer, Datia Stockholm (Remotely)

Also joined at an early stage (we were only 4 people). I built the entire UI for the product by using multiple technologies like Next.js, MUI, Tanstack Query, TailwindCSS, Cypress, Storybook, Formik, Framer-motion and a lot more. Been part of multiple conversations with clients, software architecture decisions and more.

Understood exactly what working on a startup means. We went from being 4 people to being almost 20 and we built a lot of cool stuff to be able to scale a SaaS product that gradually gained customers. After this experience, I can truly say I really love working at startups.

Feb 2025 — Present Co-founder, Dogma Buenos Aires

Dogma is the easiest way to discover electronic music events close to you in Argentina. You can find mainstream, under, sunsets and after parties, all in one app. We recently launched our own ticketing system, so we also allow users to buy, see and scan tickets (QRs codes) for some events directly in our app.

We currently have our:

- web-app: <https://getdogma.app/web/home>
- mobile app (react native): <https://getdogma.app/download>
- website: <https://getdogma.app>

Some of the technologies we use:

- Frontend: Next.JS, React Native with Expo, TailwindCSS, Tanstack Query.

- Backend: Express with TypeScript, Prisma, Supabase (with Supabase Cron, Supabase Redis Wrapper), Firebase, MercadoPago for payments.
- Extra: We built scrappers and AI-completion systems with technologies like Puppeteer and OpenAI API (mostly for image analysis).

This is a project that my girlfriend and I built together during the weekends.

Oct 2025 — Present Software Engineer, Connect Earth London (Remotely)

For context, Connect Earth is the company who acquired Datia in October, 2025:

<https://connect.earth/resources/news-and-insights/connect-earth-acquires-datia>

Basically, I'm currently doing and maintaining the same things I detailed I did at Datia.

LANGUAGES

Spanish – Native speaker

English – Good working knowledge
